## Finite state transducers

A quick introduction

- A *finite state transducer* (FST) is a finite state machine where transitions are conditioned on pairs of symbols
- The machine moves between the states based on an *input symbol*, while it outputs the corresponding *output symbol*
- An FST encodes a *relation*, a mapping from a set to another
- The relation defined by an FST is called a *regular* (or *natural*) relation

Introduction Operations on FSTs Determining FSTs Summary

## Formal definition

A finite state transducer is a tuple  $(\Sigma_1, \Sigma_2, Q, q_0, F, \Delta)$

$\Sigma_1$  is the *input alphabet*

$\Sigma_2$  is the *output alphabet*

$Q$  a finite set of states

$q_0$  is the start state,  $q_0 \in Q$

$F$  is the set of accepting states,  $F \subseteq Q$

$\Delta$  is a relation ( $\Delta : Q \times \Sigma_1 \rightarrow Q \times \Sigma_2$ )

Introduction Operations on FSTs Determining FSTs Summary

## Where do we use FSTs?

example 1: morphological analysis

In this lecture, we treat an FSA as a simple FST that outputs its input:  
the edge label 'a' is a shorthand for 'a:a'.

Introduction Operations on FSTs Determining FSTs Summary

## Closure properties of FSTs

Like PSA, FSTs are closed under some operations.

- Concatenation
- Kleene star
- Complement
- Reversal
- Union
- intersection
- Inversion
- Composition

Winter Semester 2022/23 6 / 34

Introduction Operations on FSTs Determining FSTs Summary

## FST composition

sequential application

$M_1; M_2$

aa	$M_1 \xrightarrow{ab} 1$	$M_2 \xrightarrow{b} 0$	$M_1; M_2 \xrightarrow{ab} 0$
bb	$M_1 \xrightarrow{ab} 1$	$M_2 \xrightarrow{b} 0$	$M_1; M_2 \xrightarrow{ab} 0$
aaaa	$M_1 \xrightarrow{ab} 1$	$M_2 \xrightarrow{b} 0$	$M_1; M_2 \xrightarrow{ab} 0$
abaa	$M_1 \xrightarrow{ab} 1$	$M_2 \xrightarrow{b} 0$	$M_1; M_2 \xrightarrow{ab} 0$

- Can we compose two FSTs without running them sequentially?

Introduction Operations on FSTs Determining FSTs Summary

## Where do we use FSTs?

Uses in NLP/CL

- Morphological analysis
- Spelling correction
- Transliteration
- Speech recognition
- Grapheme-to-phoneme mapping
- Normalization
- Tokenization
- POS tagging (not typical, but done)
- partial parsing / chunking
- ...

Introduction Operations on FSTs Determining FSTs Summary

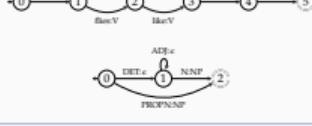

## Where do we use FSTs?

example 2: POS tagging / shallow parsing

Introduction Operations on FSTs Determining FSTs Summary

## Where do we use FSTs?

example 2: POS tagging / shallow parsing

Note: (1) It is important to express the ambiguity. (2) This gets interesting if we can 'compose' these automata.

Introduction Operations on FSTs Determining FSTs Summary

## FST inversion

- Since an FST encodes a relation, it can be reversed
- Inverse of an FST swaps the input symbols with output symbols
- We indicate inverse of an FST  $M$  with  $M^{-1}$

**FST composition****FST composition****Projection**

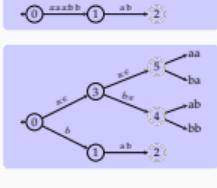

- Projection turns an FST into a PSA, accepting either the input language or the output language

**Sequential FSTs**

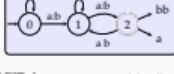

- A sequential FST has a single transition from each state on every *input* symbol
- Output symbols can be strings, as well as c
- The recognition is linear in the length of input
- However, sequential FSTs do not allow ambiguity

**An exercise**

Convert the following FST to a subsequential FST

**Subsequential FSTs**

- A  $k$ -subsequential FST is a sequential FST which can output up to  $k$  strings at an accepting state
- Subsequential transducers allow limited ambiguity
- Recognition time is still linear

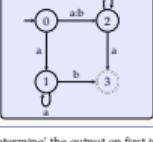

- The 2-subsequential FST above maps every string it accepts to two strings, e.g.,
  - $baa \rightarrow bba$
  - $baa \rightarrow bbb$

**Determinizing FSTs**

Another example

Can you convert the following FST to a subsequential FST?

Note that we cannot 'determine' the output on first input, until reaching the final input.

**PSA vs FST**

- PSA are acceptors, FSTs are transducers
- PSA accept or reject their input, FSTs produce output(s) for the inputs they accept
- PSA define sets, FSTs define relations between sets
- FSTs share many properties of PSAs. However,
  - FSTs are not closed under intersection and complement
  - We can compose (and invert) the FSTs
  - Determinizing FSTs is not always possible
- Both PSA and FSTs can be weighted (not covered in this course)

Next:

- Parsing
